

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

- 1.(currently amended) An active endoscopic PhotoDynamic Therapy (PDT) device comprising:
a distal and a proximal end;
a radiation source positioned at said distal end;
means for [to homogenize/scatter] homogenizing and scattering radiation from said source;
wherein said source provides a diffuse radiation pattern across a section of body tissue, which is large compared to said endoscopic device's distal cross section, and which is in proximity to said distal end; and
wherein said radiation source is powered remotely and operates at a pre-selected wavelength and power range compatible with requirements of an earlier selected PDT drug.
- 2.(original) An active endoscopic device according to claim 1, wherein said radiation source is a multitude of diodes mounted on said device's distal end so as to create an illumination pattern to effectively irradiate a selected treatment site.
- 3.(original) An active endoscopic device according to claim 2, wherein said diodes are diode lasers.
- 4.(previously amended) An active endoscopic device according to claim 3, wherein said diode lasers comprise lasers operating at different wavelengths.
- 5.(currently amended) An active endoscopic device according to claim 1, wherein said radiation source is provided by chemiluminescence, said chemiluminescence activating said selected PDT drug and originating at the distal end of said device.
- 6.(original) An active endoscopic device according to claim 1, further comprising cooling means.
- 7.(original) An active endoscopic device according to claim 1, further comprising means [to deliver] for delivering a substance which will be activated by said radiation.
- 8.(cancelled)

9.(original) An active endoscopic device according to claim 1, further comprising at least one balloon to serve as a centering mechanism.

10.(previously amended) An active endoscopic device according to claim 9, wherein said homogenizing means is a partially reflective coating on said at least one balloon.

11.(currently amended) A method of performing PhotoDynamic Therapy with an active endoscopic device as in claim 1, comprising the steps of:

positioning a catheter/endoscope into a patient and directing it to a predetermined treatment site within said patient.

placing said active endoscopic device into said endoscope/catheter and advancing it so that its distal end with its radiation source and means [to homogenize/scatter its] for homogenizing and scattering radiation are at a distal end of said endoscope; and

energizing said radiation source and irradiating said selected treatment site for times and periods to achieve said PDT treatment for said selected treatment sites.

12.(previously added) An active endoscopic device according to claim 2, wherein said homogenizing means is a partially reflective film over said multitude of diodes.
